

Simple Cards Package

This is a sample Multi-image project that you can use to get started toward authoring projects on the Selene Network. It is a free downloadable ZIP file that contains all the elements that are needed to launch your own smart contract to the blockchain and host the project on your own server.

The idea is to empower anyone to be able to launch a Selene Network compatible smart contract on the Theta blockchain and host it on your own server so that the Selene Network software can interact with it.

Description

The ZIP file is named 'cardsv1.zip' and it is found on <https://AmorStyle.com/download>.

Inside this zip file download, you will find the source, byte code and ABI for a generic multi-image smart contract that is designed to work with the high-level Selene Network code. Feel free to use that compiled code directly, for it can be configured after launch.

Also in this download, you will get instructions that show you how to launch and configure that smart contract so that you can use it for simple tasks like token-gating videos.

This is the Simple Cards Selene Network Compatible Smart Contract Package.

Requirements

All Selene Network projects need to be hosted on a public server. It is expected that the author either has the ability to host files on a server or is working with someone that can host their project for them.

More Info

In order to show off this generic multi-image Selene Network compatible smart contract, the sample of this project has been launched on chain and allows for minting. Feel free to interact with this contract and mint a card. All cards minted help support the work I do of giving away Selene Network compatible smart contracts.

Minting

It's like tipping, because the meat of the project is already downloadable from the link above. Yet, the contract is pretty cool, pick up a card or two!

Commissions

Agent commissions are set a 10% and IT commissions set at 5%. Paid in tfuel at time of mint.

High level overview

This project file download is expected to be used by creators that want to author NFT/DAT projects through the Selene Network. The project is provided as a template that should be modified (slightly, or more) before launching your own version.

The two files in the doc directory of the ZIP file guide the project creator by not only showing what needs to change but why.

This sample does not require any coding experience, but it does take some intelligence to learn and understand what needs to be changed and why.

Disclaimer

As with any software, use at your own risk. If there are bugs, please fix them. Also understand that there are dependences on other projects like Metamask, ThetaScan and other websites/tools (like the Selene Network software itself) that may or may not introduce blocking bugs.
