

The Gallery Smart Contract

Every Selene Network install needs to have its own Gallery smart contract that manages what the default install offers to any website visitor.

This smart contract allows the owner to register well formed JSON files that define what is being offered by the install on the specific server.

If used correctly, the Gallery smart contract can be used to create multiple useful Galleries that can serve different users on the same website.

Note that a version of the Gallery smart contract is included with every Selene Network install zip file.

More Info

A copy of the galleryv2.zip file can also be found on <https://amorstyle.com/download>.

The ZIP file also has a gallery_usage.pdf that should be referenced to see how to use the smart contract.

Disclaimer

As with any software, use at your own risk. If there are bugs, please fix them. Also understand that there are dependences on other projects like Metamask, ThetaScan and other websites/tools (like the Selene Network software itself) that may or may not introduce blocking bugs.
